

Data Summarize

- I downloaded all the given files and imported them into **Power BI**.
- After that I opened **Power Query Editor** to clean and prepare the data before building the model.
- Removed empty or null values from the data set.
- In Power Query Editor I checked whole data set and assign correct data type like date, whole number, etc.
- the tables with **Dim** are dimension tables and table with **Fact** are fact tables.
- I also assign **primary keys** as **PK** in dimension tables and **foreign keys** as **FK** in fact tables.
- In **Model View** I make the **Sales_Fact** table center and around it put all other **Dimension** tables.

- I manually created relationships between **Sales_Fact** and all dimension tables using **primary key–foreign key** logic.
- I connected **Sales_Fact** with **Customer_Dimension**, **Product_Dimension**, **Region_Dimension**, and **Date_Dimension**.
- I also linked **Returns_Fact** with **Sales_Fact** using **SalesID** to track returned sales.
- I connected **Returns_Fact** to **Date_Dimension** using **ReturnDateKey** and make the relation **inactive**.
- I also checked all relationships to make sure **the cardinality** and **cross-filtering** direction were correct.
- I created **hierarchies** in the dimension tables, like **Date hierarchy**, **Product hierarchy**, and **Region hierarchy**, as mentioned in the project.
- To verify I used **Matrix visual**.
